What Happens After the Decision

From synthetic funding and monitoring to permitted action, portfolio insight and certification.

1 BOOKING & ACTIVATION

Only an authorized, physically funded scenario path enters the account lifecycle.

- **Authorized terms** — Selected amount and governed financing terms.
- **Path identity** — Run, scenario, application, account and advance.
- **Synthetic funding** — Recorded funding—not a real transfer.
- **Source handoff** — Funding dates, keys and retained decision evidence.
- **Account activation** — The exact funded path enters monitoring.

Monitoring begins at the source-owned first expected remittance.

2 DAILY MONITORING LOGIC

On unpaid paths, overlapping signals feed source-defined monitoring status.

OVERLAPPING MONITORING FAMILIES

- **No remittance** — Elapsed days without positive remittance.
- **Sales dormancy** — Consecutive zero-sales days.
- **Liquidity** — Balance, NSF events and negative-balance evidence.
- **Pace** — Cumulative remittance versus capped expectation.
- **Horizon** — Unpaid balance beyond the selected horizon.

NON-CURRENT MONITORING STATUSES

- **WATCH** — Watch-level condition; no higher-priority status.
- **UNDER-PERFORMING** — Adverse pace; no overriding status.
- **SEVERE SHORTFALL** — Severe pace or unpaid horizon overrun.
- **DORMANT NO REMITTANCE** — Source no-remittance threshold reached.

21/30/3 applies to pace; other families have their own triggers.

- **21** — Pace WATCH eligible day 21
- **30** — Pace adverse eligible day 30
- **3** — 3 consecutive eligible-day pace breaches

3 INTERVENTION ROUTES

Recommendations do not grant execution permission.

130 funded scenario paths across two alternatives.

- **No further action** — 126 paid-off paths → **Certified paid-off state**
- **Targeted outreach review** — 3 paths → **Setup + processing permissions** → **Review hold** — Processing held → **Certified held state**
- **Temporary remittance review** — 1 path → **Setup + processing permissions** → **Permitted servicing** — Payments, returns and retries → **Certified account state**

Recommendation ≠ execution. Horizon reached ≠ balance extinguished.

4 WHAT THE SYSTEM PROVES

Monitoring turns daily account behavior into explainable portfolio evidence.

BUSINESS QUESTION	WHAT THE SYSTEM PROVIDES
Is the merchant tracking to plan?	Compare source-owned sales, remittances and expected pace.
How much receivable remains?	Read the balance at the selected observation date and source stage.
Are issues temporary or persistent?	Inspect active families, status and eligible-day persistence.
Which accounts need attention?	Read status, reasons, exposure and permitted servicing state.

Source-owned evidence supports explainable portfolio decisions.

5 PORTFOLIO INTELLIGENCE & CERTIFICATION

Reconciled source evidence feeds certification and analytical consumption.

- **Payment reconciliation** — Match payments, returns, retries and balances.
- **Account-state certification** — Certify permitted account states and retained evidence.
- **Portfolio facts & analysis** — Source-owned exposure, state and scenario comparisons.
- **G3-v2 source certification** — Certify the versioned source-consumption boundary.
- **Power BI P01–P04** — Consume certified facts in analytical views.

Power BI consumes certified facts; it does not create certification.

- **MONITOR** — Read the signals and their context.
- **ROUTE** — Respect review and permission boundaries.
- **EXPLAIN** — Trace evidence to account and portfolio results.
- **CERTIFY** — Reconcile states; retain the evidence.

Signals inform governed action. Reconciled evidence informs portfolio decisions.

Deterministic synthetic • Non-production • No real funds
